

Finalize Our Winning Model

This is the important professional transition:

The user gives raw data. The system automatically prepares it and sends it to the model.

They don't need to manually perform imputation, encoding, or scaling.

```
[94]: # Create the final pipeline
```

```
[95]: from sklearn.pipeline import Pipeline
      from sklearn.ensemble import RandomForestRegressor

      final_model = Pipeline([
          ("preprocessor", preprocessor),
          ("model", RandomForestRegressor(
              random_state = 42
          ))
      ])
```

```
[96]: # Train the final pipeline
```

```
[97]: final_model.fit(X_train, y_train)
```
